

CASE STUDY

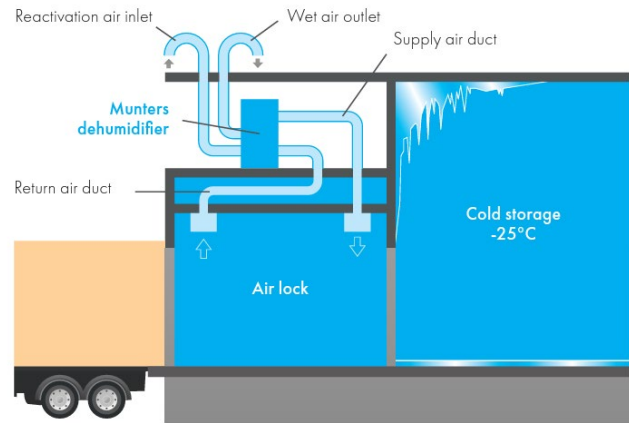

Provide a temporary dehumidification solution – Delivered, installed and started up within days.

Industry: Food & Beverage

Application: Cold Storage - Condensation

End User: American multinational beverage company

Product: Rental Desiccant Dehumidification System

Summary:

Condensation and ice-build up is a common occurrence within cold storage facilities when dehumidification is not being used. Humid air will enter the cold storage when forklifts and people move in and out. This humid air will condense and form ice on ceilings, walls and floors, as well as on the cooling system/evaporators. This customer experienced an influx of condensation as the summer season arrived and needed an immediate fix to avoid any USDA violations and safety issues. The energy savings within the existing cooling system was an added bonus!
